

Sales Performance Dashboard – Business Insights Report

Applicant Name: Sweta Singh

Application ID: KTS020260710729

Internship Domain: Data Analytics Internship(Task 1)

Project Objective

The purpose of this project is to analyse Superstore sales data and build an interactive Power BI dashboard that helps decision-makers understand revenue trends, profitability, product performance, customer activity, and regional sales performance.

Dataset

The analysis uses Superstore sales transaction data containing order details, customer information, product categories, regions, sales, discounts, quantities, and profit.

Data cleaning and preprocessing included checking data types, handling blanks and duplicates, and creating calculated date fields such as order year, month, quarter, shipping days, and profit margin percentage.

Key Performance Indicators

KPI	Result
Total Sales	\$2.30M
Total Profit	\$286.40K
Profit Margin	12.47%
Total Orders	5,009
Total Customers	793

Key Insights

1. The business generated approximately **\$2.30 million in sales** and **\$286.40 thousand in profit**, resulting in a **12.47% profit margin**.
2. The **West region** is the strongest contributor to sales performance. Regional insights help management focus sales resources and inventory availability on high-performing areas.

3. Sales and profit change across months, with stronger sales during later months of the year. The business should plan inventory, marketing campaigns, and staffing before high-demand periods.
4. Technology is a major contributor to revenue and profit. High-performing categories should receive priority for stock management and promotional campaigns.
5. The Top 10 Products by Sales chart shows that a small number of products contribute strongly to total revenue. These products should be kept in stock and monitored for demand changes.
6. California, New York, Washington, and Michigan are among the strongest states by profit. These states can be used as benchmarks for identifying effective sales strategies.
7. States or products showing negative profit should be reviewed for high discounts, pricing issues, shipping costs, or low-margin product combinations.

Recommendations

- Prioritise inventory planning for top-selling products and high-performing categories.
- Focus marketing campaigns on strong regions while improving weaker regional performance.
- Review high-discount transactions that may reduce profit.
- Analyse loss-making states and products to identify causes of negative profitability.

- Use monthly sales trends for seasonal demand forecasting.

Tools Used

- Power BI Desktop
- Microsoft Excel / CSV
- SQL
- Python / Jupyter Notebook
- GitHub

Conclusion

The interactive Sales Performance Dashboard provides a clear view of sales, profit, regional trends, category results, top products, and state profitability. It enables business users to make more data-driven decisions about inventory, pricing, sales focus, and regional strategy.
